

The audience of my website is anyone who might be interested in learning a little more about the show Sherlock, although not necessarily hard-core fans, which is why I didn't include very in-depth information and included links/descriptions of the episodes. The backgrounds are generally leaning dark, not only to match the theme of the show (mystery), but also to include canon references within the background and titles in each page to the show. There is a high emphasis on pictures/visuals, not only to mirror the highly appealing visuals in the show but also to draw possible fans in.

PHP was used in all pages besides the home page because the repetition of the same structures (pictures with text) or with the form made a for-loop the better choice; it reduces the possibility for errors and allows for each part to be identical and makes the website appear neat/tidy as well.

My WOW element is the extensive amount of PHP used to code almost the website entirely besides the homepage and leading to interesting functionalities such as conditional background images of webpages (varies with the quiz result) and the javascript creating different summaries for each episode upon hovering over them.

P.S. The "grade.php" page cannot be reached by the user unless they fill out the quiz, and thus I didn't validate it.
